

# Selected news on strangeness production at the LHC

*QCD challenges from pp to AA* Münster 2-6 Sep. 2024

\* Livio.Bianchi@cern.ch

## Strange hadron yields from small to large systems

2

23

Ratio of yields to  $(\pi^++\pi^-)$ p+<u>p</u> (×6)  $12K_{e}^{0}$ 0<sup>-1</sup>  $\Lambda + \overline{\Lambda} (\times 2)$  $2\Phi$  (×2) <sup>-</sup>+Ξ<sup>+</sup> (×3) 10<sup>-2</sup>  $\Omega^{-}+\overline{\Omega}^{+}$  (×12)-ALICE O pp.  $\sqrt{s} = 7 \text{ TeV}$ • ALICE Preliminary pp. **v**s = 13 TeV  $\Diamond$  p-Pb,  $\sqrt{s_{NN}} = 5.02 \text{ TeV}$ ♦ p-Pb, √s<sub>NN</sub> = 8.16 TeV 10<sup>-3</sup> ¥ Xe-Xe, √s<sub>NN</sub> = 5.44 TeV (K<sup>0</sup><sub>2</sub>, Ξ, Ω) ¥ Xe-Xe, √s<sub>NN</sub> = 5.44 TeV (p, Φ)— Pb-Pb,  $\sqrt{s_{NN}} = 5.02 \text{ TeV} (K_{0}^{0}, \Lambda, \Xi, \Omega)$ ■ Pb-Pb, √s<sub>NN</sub> = 5.02 TeV (p, Φ)  $10^{3}$ 10<sup>2</sup> 10<sup>4</sup> 10  $\left<\mathrm{d}\mathrm{N_{ch}}\!/\mathrm{d}\eta\right>_{\left|\eta
ight|<0.5}$ ALI-PREL-321075

ALICE, Nature Physics 13, 535-539 (2017)

Iconic figure at the LHC:

- smooth strangeness enhancement (SE) VS final state multiplicity
- Strange content hierarchy:  $SE(\Omega) > SE(\Xi) > SE(\Lambda, K_{s}^{0})$
- strangeness- and not baryon-related
- peculiar role of φ meson

### Strange, but also not strange!

ALICE Collaboration, The ALICE experiment: a journey through QCD, Eur. Phys. J. C 84,

### The ratio depends on the event multiplicity in a **qualitatively similar** way **in pp, p-Pb and Pb-Pb**

The magnitude is smaller in pp with respect to p-Pb and Pb-Pb, but note that for similar percentiles  $\langle dN_{ch}/d\eta \rangle$  is dramatically different among the three systems

In small systems spectra evolve with  $\langle dN_{ch}/d\eta \rangle$  in a qualitative similar way as in heavy ion collisions (valid for all identified particles studied)

## Striking similarities between light and heavy flavors in small systems

### Intriguing observation:

- Hydro for charm? Hard to believe! Not supported by A-A observations:  $\Rightarrow \text{low-}p_{T} \text{ hierarchy } v_{2}^{h} > v_{2}^{c} > v_{2}^{cc}$  $\Rightarrow \Lambda/K_{S}^{0} > \Lambda_{c}/D_{0}$ 
  - $\Rightarrow$  Challenges hydro hypothesis for light flavors in pp
- Coalescence at intermediate p<sub>T</sub> with same net effect for light and heavy flavors?

Need to extend  $\Lambda_c/D_0$  at lower  $p_T$  and with larger statistics

## Recent extensions: $P(n_s)$

## $P(n_s)$ : multiplicity distribution of strange hadrons in pp@5.02 TeV

Livio Bianchi QCDCppAA 3 Sep 2024

23

Unique opportunity to test the connection between average-charged and strange particle multiplicity production throughout very extreme situations

From this strange particle multiplicity distribution, the average production yield of *n* particles per event can be calculated through:

$$\langle \mathbf{Y}_{nS} \rangle = \sum_{i=n}^{n^{max}} \frac{i!}{n!(i-n)!} \cdot \mathbf{P}(n)$$

- (Y<sub>1S</sub>) is the average of the multiplicity distribution
   (corresponding to what was called "dN/dy" or "yield" in previous publications)
- (Y<sub>n>1 S</sub>) identifies the average production yield of doublets, triplets, ..., multiplets of the given particle.

ALI-PREL-571995

## $\langle Y_{ns} \rangle$ : multiplets production yields

#### Livio Bianchi QCDCppAA 3 Sep 2024

## Agreement with models deteriorates with increasing *n*

Comparison to models very statistics demanding! 10B events here. Would be interesting to see comparison to EPOS 4

No difference in predictions from Monash and QCD-CR Ropes for  $K^0_{s}$ , while large improvements for baryons  $\rightarrow$  trend with multiplicity well described, but undershooting

EPOS-LHC: better agreement at high multiplicity than at low

### $\Delta S=0$ ratios

Enhancement with multiplicity not connected to strangeness unbalance (mass? baryon number? ... )

Very well described by Pythia 8 QCD-CR Ropes

Livio Bianchi QCDCppAA 3 Sep 2024

### $\Delta S=0$ ratios

Enhancement with multiplicity not connected to strangeness unbalance (mass? baryon number? ... )

Very well described by Pythia 8 QCD-CR Ropes

Not mass  $(m_{\Xi} > 2*m_{KOS})$ Not baryon number

number of light quarks involved!

Again, good description by Pythia 8 QCD-CR Ropes which does a good job in re-connecting strange to lighter quarks

Is it all played by QCD-CR or ropes actually plays a role?

Many more ratios to come!

Production in- and out-of-jet

## Are spectra modified in the same way in- and out-of-the jet?

(hadron, jet)

 $\Delta n^2 + \Delta \omega^2$ 

nge hadron( $\varphi, \eta$ )

 $jet(\varphi, \eta)$

primary

particles

#### Leading hadron method:

- jet direction: the one of the highest  $p_{\tau}$  hadron •
- $p_{\tau}^{\text{leading}} > 4-5 \text{ GeV/c}$ •
- hadron-strange correlation method to extract particle yields in- and out-of-the jet

#### Jet finding:

- Charged track selection:  $|\eta| < 0.9, p_{_{
  m T}} > 0.15 \, {
  m GeV/}c$
- Jet finder: anti- $k_{\tau}$ , R = 0.4,  $|\eta_{\rm jet}| < 0.35, p_{\rm T,iet} > 10 ~{\rm GeV/}c$
- Strange particles found in:
  - Jet Cone  $\rightarrow$ Ο
  - $R_{\rm Strange hadron, \, jet} = \sqrt{(\Delta \eta^2 + \Delta \varphi^2)} < 0.4$
  - Underlying Event  $\rightarrow$  perp. cone method Ο
  - Jet fragmentation  $\rightarrow$  JE = JC UE Ο

## baryon/meson anomaly in- and out-of-jet in pp

ALICE, Phys. Lett. B 827 (2022) 136984

Spectra are harder in the jet than in the perpendicular cone (UE)

Dynamics in the baryon/meson are dominated by what observed in the UE

Statistics-hungry analysis, but missing the multiplicity dependence we miss part of the fun! Need to change our "definition" of jet

Livio Bianchi QCDCppAA 3 Sep 2024

14

#### ALICE Collaboration, arXiv:2405.14511

(multi-)strange hadrons are mostly produced outside the jet [in events with a leading particle with  $p_{\tau} > 3-4 \text{ GeV}/c$ ]

## ... spectra evolution observed only in the transverse to leading...

ALICE Collaboration, arXiv:2405.14511

## Strangeness enhancement in- and out-of-the jet

### ... but (in-) and (out-of-)jet SE looks ~the same...

## New classifiers

## Spherocity

 $S_{\rm O}^{p_{\rm T}=1} = \frac{\pi^2}{4} \min_{\hat{n}} \left( \frac{\Sigma_i |p_{{\rm T},i} \times \hat{n}|}{N_{\rm trive}} \right)^2$ 

A measurement of the degree of collimation of the spray of particles:

- $S_0 \rightarrow 0$  very collimated jet-like topology
- $S_0 \rightarrow 1$  spherical event collective system?

#### Fixed multiplicity at mid-rapidity

 $\hookrightarrow$  S<sub>o</sub> is correlated to the  $< p_T >$  of pions

Fixed multiplicity at forward rapidity:

⇒  $S_0$  is only mildly correlated to  $<p_T>$ , but more correlated to  $dN_{\pi}/dy$ 

Livio Bianchi

QCDCppAA 3 Sep 2024

## SE in HM VS Spherocity

19

\_\_\_\_

23

ALICE Collaboration, J. High Energ. Phys. 2024, 184 (2024)

Fixed multiplicity at mid-rapidity

 $\hookrightarrow$  High S<sub>0</sub>  $\rightarrow$  larger strangeness production

Fixed multiplicity at forward rapidity:

 $\Rightarrow$  in this case S<sub>o</sub> is not a good knob for strangeness

### Flattenicity

$$\rho = \frac{\sqrt{\sum_{i=1}^{64} (N_{\rm ch}^{\rm cell,i} - \langle N_{\rm ch}^{\rm cell} \rangle)^2 / N_{\rm cel}^2}}{\langle N_{\rm ch}^{\rm cell} \rangle}$$

A measurement of the local multiplicity fluctuations in the VOM detector:

- $1-\rho \rightarrow 0$  high flattenicity large N<sub>MPI</sub>
- $1-\rho \rightarrow 1$  small flattenicity small N<sub>MPL</sub>

Flattenicity (which is mostly a multiplicity estimator) is able to deplete the high-pT bias

20

Flattenicity

#### ... and the effect is reproduced by Pythia only with CR

## Up for discussion

### Wrap-up

- In the years strangeness enhancement is turning into a "less-common stuff" enhancement
  - connection to charm hadronization?
  - does strangeness retain a "higher status"? Probably not
- Multiple (multi-)strange hadron production VS VOM multiplicity
  - ratio of multiplet yields shows enhancing  $\Lambda/K_s^0$  ratio and  $2\Xi/4K_s^0$  decreases with multiplicity. Light quarks are playing a role! would coalescence calculations get these trends?
  - near future: several other ratios (e.g. SE at its extremes!)
  - CR junctions nicely re-connects strangeness with lighter quarks. Yet strangeness abundance remains a challenge. Does Rope actually help?
- In and out-of jet studies seem point to:
  - strangeness production dominance and spectra evolution only outside the jet
  - SE outside the jet and (potentially) same SE in the jet. Does this observation challenge the Core-Corona approach?
- New classifiers:
  - spherocity correlates to SE at fixed local multiplicity but not at fixed forward multiplicity
    - is this coming from its correlation to p<sub>7</sub>? Despite this, we have a knob to tune strangeness at fixed multiplicity
  - $\circ$  flattenicity aims at removing the high-p\_ tias
    - current result hints at potential success. Larger statistics may help

Livio Bianchi

QCDCppAA 3 Sep 2024

## Fix N<sub>ch</sub> - SE VS Spherocity - Model comparison

Livio Bianchi QCDCppAA 3 Sep 2024

### Fix VOM - no SE VS Spherocity - model comparison

Livio Bianchi QCDCppAA 3 Sep 2024 25

Not only we observe  $v_2$  in small systems, but the **particle hierarchy** (in different  $p_{\tau}$  regions) is the one that we expect from hydro and observe in Pb-Pb collisions

2d / (p + p) Thermal-FIST CSM (PLB 785 (2018) 171-174), T = 155 MeV 0.005  $-V_{\rm c} = {\rm d}V/{\rm d}y$  $V_c = 3 \, \mathrm{d}V/\mathrm{d}y$  Coalescence (PLB 792 (2019) 132-137) 0.004 Multiplicity Classes: V0A (Pb-side) for p-Pb V0M for pp and Pb-Pb 0.003 ALICE 0.002 pp, 7 TeV pp, 13 TeV Pb-Pb, 2.76 TeV 0.001 p-Pb, 5.02 TeV p-Pb, 8.16 TeV (Prel.) 10<sup>2</sup>  $10^{3}$ 10  $\left<\mathrm{d}\mathrm{\textit{N}}_{\mathrm{ch}}\,/\,\mathrm{d}\eta_{\mathrm{lab}}
ight>_{\left|\eta_{\mathrm{lab}}
ight|<0.5}$ ALI-PREL-344619

#### d, <sup>3</sup>He and <sup>3</sup>H significantly enhanced throughout multiplicity!

What causes this enhancement? Lifting of canonical suppression? Coalescence probability at kinetic freeze-out?

Qualitative agreement with Thermal Canonical Statistical Model and coalescence model.

## SE in HM VS Spherocity

Livio Bianchi QCDCppAA 3 Sep 2024

## Forward energy anti-correlated to N<sub>MPI</sub>

30

In pp collisions strangeness production is found to increase with midrapidity multiplicity and to be anti-correlated with the leading energy

Multi-differential approach to disentangle the contribution of multiplicity and effective energy to strange particle production:

- an increase in strange baryon production is observed at fixed midrapidity multiplicity
- strangeness production shows a correlation with the effective energy following a universal trend with the leading energy detected by the ZDC
